

CIVIL WORK

CIVIL WORK

We design your mobile communications system, handle the permitting process and build needed infrastructure. Experienced project and site managers take responsibility for coordination, monitoring and reporting as the work proceeds.

We prepare blueprints verified up by station visits, technical specifications and negotiations with the owners.

A building permit is essential for implementation, but securing it can consume a great deal of time if there is opposition.

Structural steel is fabricated and assembled in accordance with engineering drawings and static calculations.

Containers, buildings, modular cubicle systems and other configurations are available for the system hardware. All are customized to meet the project requirements.

Test reports are generated as soon as electric power feeds are wired, climate control is on line, and lightning protection has been installed.

All work is described in a final set of documentation, which is handed over to the site owner once the facility has been accepted.

Our areas of competence

- Structural plans
- Permits
- Structural steel
- Equipment rooms
- Electrical installation
