

ANTENNA CONSTRUCTION AND INTEGRATION

ANTENNA CONSTRUCTION AND INTEGRATION

We observe rigorous safety practices when installing HF cables and antennas. In installing and commissioning electronic hardware, we focus above all on the technical specifications.

The antenna construction department provides installation in compliance with the latest technical specifications, marks HF cables, installs both preamplifiers and antennas, and aligns the equipment in azimuth, elevation, and mechanical and electrical tilt.

Directional radio installation and alignment work continues during cold and snowy weather. We can perform this work at heights of up to 50 meters. Using the most up-to-date instruments, ETAVIS measures and inspects systems and validates and documents its measurements.

Our certified and seasoned experts employ special tools, experience and skills to deliver and install a base station weighing up to 800 kg. The same trip includes bringing the station on line and commissioning and integrating it.

Our areas of competence

- Implementation
- Antenna construction
- Directional radio installation
- Measurements
- Base station installation
- Commissioning
